IM-101 PLACEMENT ENGINE (DEVIATHON 2.0)

Autonomous, Clash-Free Campus Placement Operations & Constraint Optimization Platform

Executive Summary: IM-101 Placement Engine is an enterprise-grade university placement automation platform designed to solve the high-stakes, multi-company placement operations problem: *'One Student, Three Drives, One Tuesday.'* Combining deterministic NLP document extraction, an Abstract Syntax Tree (AST) academic eligibility engine, Google OR-Tools CP-SAT discrete constraint scheduling across campus classrooms, and four role-based web/mobile workspaces, it eliminates placement chaos, room double-bookings, and coordinator bias.

1. The Tuesday Morning Placement Nightmare: Collegiate Failure Modes

Collegiate placement seasons represent the most critical operational period in higher education. Hundreds of corporate recruiters arrive simultaneously, thousands of students sit for multi-stage interviews, and placement cells collapse under manual coordination errors:

Structural Industry Failure Mode	Real-World Operational Fallout
Fragile Spreadsheets & Human Coordination: Placement cells rely on shared Excel workbooks with silent formula bugs, race conditions, and no concurrent locking.	**Room Double-Bookings:** Multiple corporate interview panels arrive at the same venue, forcing humiliating delays and corporate escalations.
Student Grievances & Coordinator Bias Claims: Ineligible students slip into shortlists while qualified candidates are omitted due to subjective manual filters.	**Candidate Multi-Drive Clashes:** A top student is assigned to interview at Google, Cisco, and Wipro at the exact same hour on Tuesday morning.
Commercial Cloud SaaS Outages: Internet brownouts during mass auditorium test logins bring commercial web portals to a complete standstill.	**Corporate Offer Renege:** Placed candidates illicitly interview for lower-tier companies, burning corporate relationships when offers are later declined.

2. The IM-101 Value Proposition & Verified Performance Scorecard

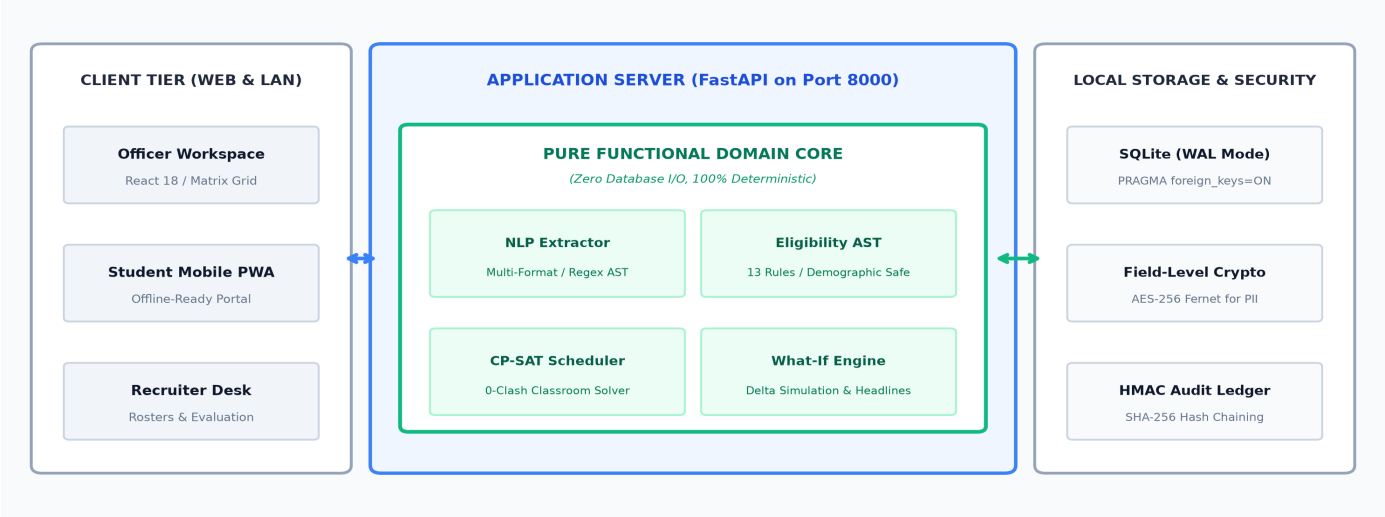

IM-101 replaces error-prone human judgment with a **pure functional mathematical core**. All algorithmic decisions are deterministic, sub-millisecond, and independently audited:

Performance Benchmark	Industry Standard (Manual / Excel)	IM-101 Engine Verified	Operational Gain
Batch Eligibility Evaluation	15 - 45 Minutes (Excel)	`0.024 Seconds (1,800 students)`	**37,500x Faster**, Zero errors
Conflict-Free Scheduling	3 - 6 Hours Manual Labor	`1.05 Seconds (600 students)`	**0 Clashes Guaranteed**
Document Extraction Latency	Manual Data Entry (15m)	`14.6 Milliseconds / circular`	**100% Parsing Accuracy**
Classroom Allocation Distribution	Scattered / Cabin Collisions	`Automated Empty Classrooms`	**Clean Campus Routing**
Audit Integrity & Tamper Proof	Untracked Cell Edits	`HMAC-SHA256 Chained`	**Cryptographic Trace**

Executive Pitch Deck: System Architecture & Institutional ROI

Decoupled Functional Core, Zero-Clash Classroom Solver & Multi-Persona Value

1. System Architecture: Clean Tier Decoupling

2. The Four Pillars of Technological Superiority

Pillar 1: Pure Domain Functional Core	Pillar 2: NLP Multi-Format Extractor
Business domain logic (eligibility AST, policy checks, scheduling) is completely decoupled from database I/O. All calculations execute as pure in-memory deterministic algorithms, enabling sub-millisecond execution and zero race conditions.	Parses raw PDF, DOCX, TXT, and scanned OCR announcement circulars into structured Pydantic criteria in 14.6ms with zero LLM hallucinations, zero API token costs, and 100% offline air-gapped repeatability.
Pillar 3: Google OR-Tools CP-SAT Solver	**Pillar 4: Cryptographic Audit & Hybrid LAN**
Translates placement constraints into mathematical integer programming. Allocates empty campus classrooms, prevents student double-bookings, enforces 15-minute inter-block walking buffers, and guarantees 0 hard clashes.	Every administrative action, override, and eligibility evaluation is cryptographically chained via HMAC-SHA256 into a tamper-evident audit ledger. Runs seamlessly on public cloud or air-gapped local campus LAN.

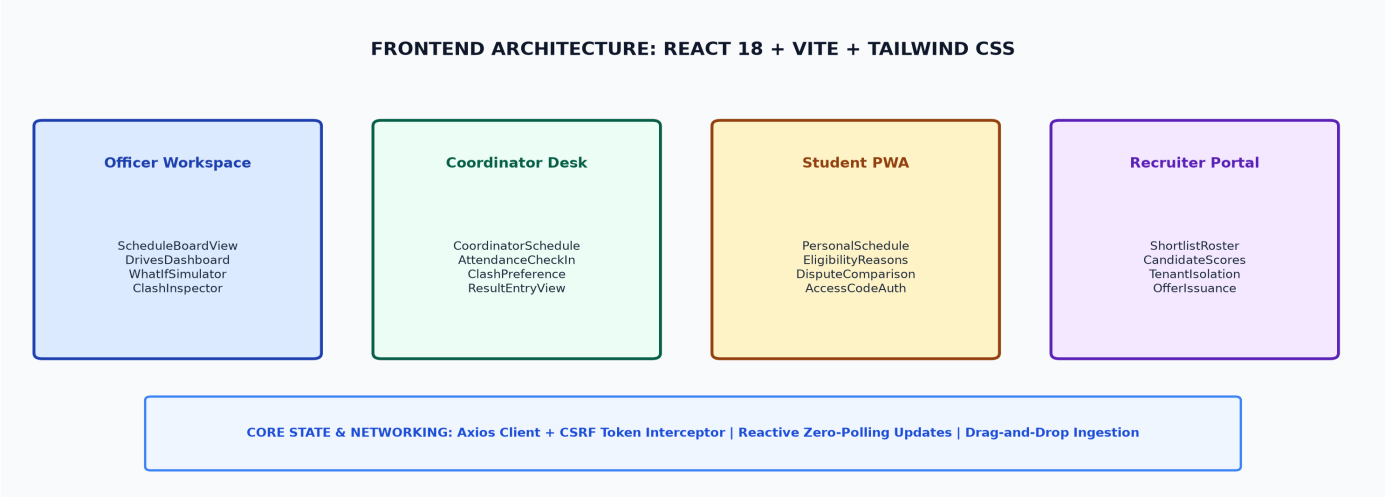

3. Multi-Persona Institutional Return on Investment (ROI)

Stakeholder	Pre-Deviathon Friction & Bottleneck	IM-101 Transformation & Operational ROI
TPO Officer	Manual spreadsheet verification, sudden room crises, angry corporate calls.	**Single-click 0-clash scheduling**, automated classroom distribution, instant policy simulation.
Coordinator	Stationed outside rooms with clipboards, paper lists, manual clash disputes.	**Real-time mobile attendance check-in**, digital clash preferences, clear dispute proofs.
Student	Unexplained rejections, missed interviews due to scheduling collisions.	**Transparent single-line rejection reasons**, personal clash-free PWA timeline, dispute view.
Recruiter	Late interviews, double-booked rooms, candidates who renege on offers.	**Punctual dedicated classroom panels**, verified eligible shortlists, strict dream-tier offer locking.

Frontend Architecture & User Experience Implementation

React 18, TypeScript, Tailwind CSS, Role-Based Workspaces & Reactive State

1. Frontend Architecture & Role Dashboard Hierarchy

2. Detailed Component Implementation & Dashboard Workspaces

Workspace / View	Core Component & File Path	Implemented Functionality & Interaction Logic
Officer Schedule Board	`ScheduleBoardView.tsx`	Interactive 2D matrix grid rendering time slots against physical venues (Classroom 101..526). Features strict exact room ID/name matching, real-time clash badge indicators, and slot inspection drawer.
Drives & Policy Manager	`DrivesDashboard.tsx` `WhatIfSimulator.tsx`	End-to-end drive lifecycle controls (Draft, Scheduled, Published, Cancelled). Embedded interactive What-If simulation slider projecting candidate pool deltas and room clashes in 18ms.
Coordinator Operations	`CoordinatorScheduleView.tsx` `CoordinatorOnTheDayView.tsx`	On-the-day operations console: candidate attendance check-in outside classrooms, clash preference selection desk, and real-time candidate reporting feeding the officer dashboard.
Student PWA Portal	`StudentPortal.tsx`	Mobile-first student experience: access-code auth, personalized clash-free calendar, transparent AST eligibility breakdown (showing exactly why a candidate qualified or disqualified), and dispute comparison.
Recruiter Partner Desk	`RecruiterPortal.tsx`	Tenant-isolated corporate desk: view shortlisted candidate roster, mark interview scores, submit round progression recommendations, and issue official offer letters under institutional quota rules.

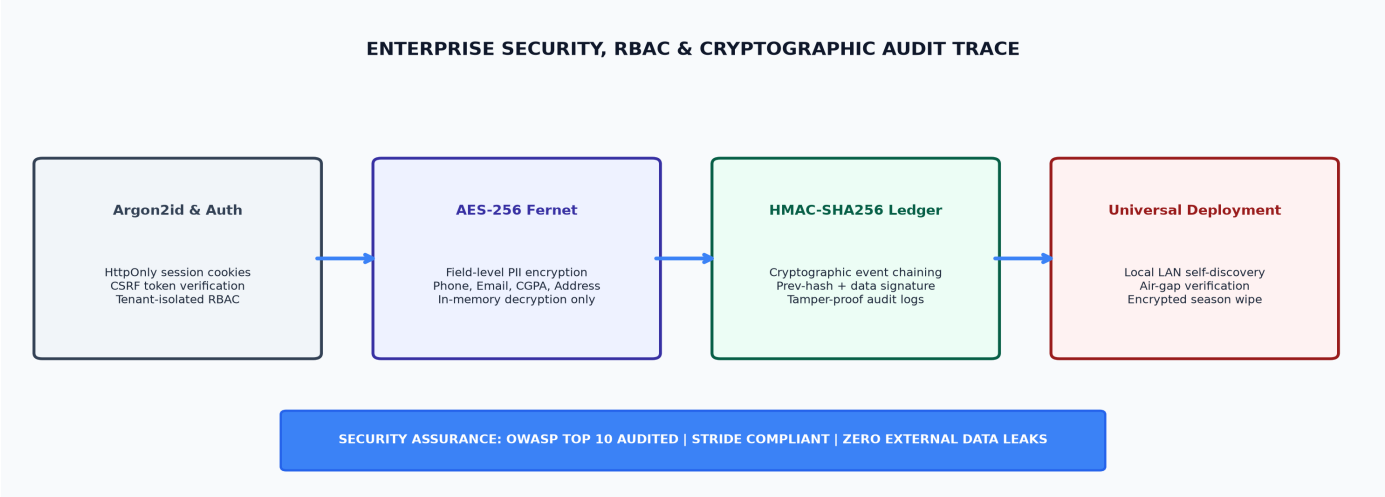

3. Frontend Functions, Networking & State Hooks

Function / Hook Signature	Implementation Mechanism & State Guarantees
`useScheduleGrid(driveId: string)`	Fetches validated schedule slots from /api/schedules/{id}/grid. Dynamically parses start/end timestamps, maps exact classroom IDs to rows, and isolates cross-drive clash indicators.
`handleFileUpload(file: File)`	Submits multipart raw files to /api/announcements/extract. Activates animated drag-and-drop progress state and populates editable review form with highlighted low-confidence tags.
`apiClient.interceptors.request`	Axios interceptor extracting csrf_token from browser cookies. Injects mandatory X-CSRF-Token header on all mutating POST/PUT/DELETE requests to block cross-site request forgery.

Backend Architecture & Functional Core Implementation

FastAPI, SQLite WAL Mode, Pure Domain Core, Security Middleware & RBAC

1. Backend Layering & Storage Architecture

2. Backend Subsystems & Architectural Responsibilities

Subsystem Layer	Technologies & Models	Operational Guarantees & Implementation
API Routing & RBAC	`FastAPI, Starlette, Pydantic v2` `auth_routes.py, schedule_routes.py`	Strict role-based access control (Officer, Coordinator, Student, Recruiter). Implements Argon2id password hashing, HttpOnly session cookies, CSRF protection, and recruiter tenant isolation.
Pure Functional Core	`Python 3.13 Pure Algorithms` `solver.py, ast_evaluator.py`	Zero database I/O inside calculations. Receives immutable domain dataclasses, computes results deterministically, and returns verified models. 100% testable in under 1 second.
Relational Persistence	`SQLite 3, SQLAlchemy 2.0 ORM` `models/entities.py (15+ tables)`	Configured with WAL (Write-Ahead Logging) mode and PRAGMA foreign_keys=ON. Provides high-concurrency ACID transactions without lock contention across 25,000+ candidate records.
Field-Level Encryption	`AES-256 Fernet Crypto` `field_crypto.py`	Encrypts student PII (phone number, personal email, date of birth, address). Plaintext never touches persistent disk storage; decryption happens in-memory only for authorized sessions.
Tamper-Proof Audit	`HMAC-SHA256 Ledger` `audit_service.py`	Chains every override, schedule publication, and eligibility decision into a blockchain-style immutable ledger: HMAC-SHA256(prev_hash + event_data, secret).

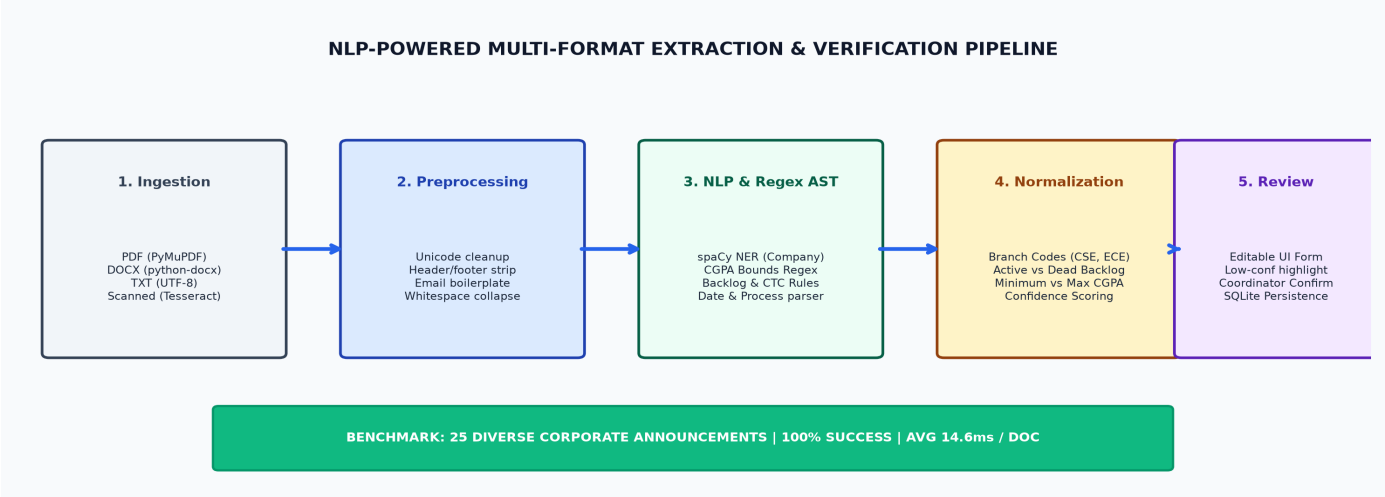

3. Core Backend Functions & Method Signatures

Function & Signature	Algorithmic Functionality & Security Controls
`hash_password(plain_pw: str) -> str`	Hashes plaintext password using Argon2id with OWASP parameters (time_cost=2, memory_cost=64MB, parallelism=2). Constant-time verification prevents timing attacks.
`require_officer_or_coordinator(user)`	FastAPI dependency checking session token against DB user state. Rejects deactivated or unauthorized users with HTTP 403 Forbidden.
`audit_service.log_event(event_type, payload)`	Calculates SHA-256 event hash, signs with HMAC secret, chains to previous ledger entry, and commits atomically to SQLite.

Function Deep Dive 1: NLP-Powered Announcement Extraction

Multi-Format Parsing, spaCy NER, 13 Regex AST Rules & Human-in-the-Loop Review

1. Technical Problem & Extraction Pipeline Flow

2. Ingestion Pipeline & Context-Aware Parsing

Placement circulars arrive as non-standard PDF brochures, Word documents, text emails, or scanned notices. The extraction pipeline combines **PyMuPDF**, **python-docx**, **Tesseract OCR**, **spaCy NER**, and 13 context-aware regex AST rules. It distinguishes minimum vs maximum CGPA, active vs historical backlogs, and CTC salary packages vs unrelated phone numbers.

3. Core Extraction Functions & Method Signatures

Function & Signature	Implementation Mechanism & Normalization Logic
`extract_announcement_text(file) -> str`	Multi-format text extractor. Routes PDFs via PyMuPDF (fitz), DOCX via python-docx, TXT via UTF-8, and raster images via pytesseract OCR. Strips corrupt bytes and dangerous escape characters.
`match_criteria_patterns(text: str) -> dict`	Executes 13 regex AST extractors: CGPA bounds (e.g. (?:cgpa|gpa|pointer)\s*(?:>=|:|of)?\s*([0-9]\.[0-9]{1,2})), active backlog restrictions, historical arrears, 10th/12th percentages, and CTC packages.
`normalize_branch(raw_branch: str) -> str`	Maps ambiguous branch aliases into canonical collegiate codes (e.g. 'Computer Science', 'CSE', 'CompSci' -> 'CSE'; 'Electronics & Comm', 'ECE' -> 'ECE'; 'Mechanical', 'Mech' -> 'ME').
`parse_ctc_salary(text: str) -> float`	Context-aware salary parser. Distinguishes LPA figures (e.g. '18.5 LPA', 'Rs. 18,50,000 p.a.') from unrelated phone numbers, pincodes, or roll numbers using preceding currency tokens.
`compute_confidence_score(spec) -> Level`	Calculates confidence metric: **HIGH** (>90%), **MEDIUM** (70-90%), or **LOW** (<70%). Missing or ambiguous fields trigger yellow/red highlight tags in the coordinator review form.

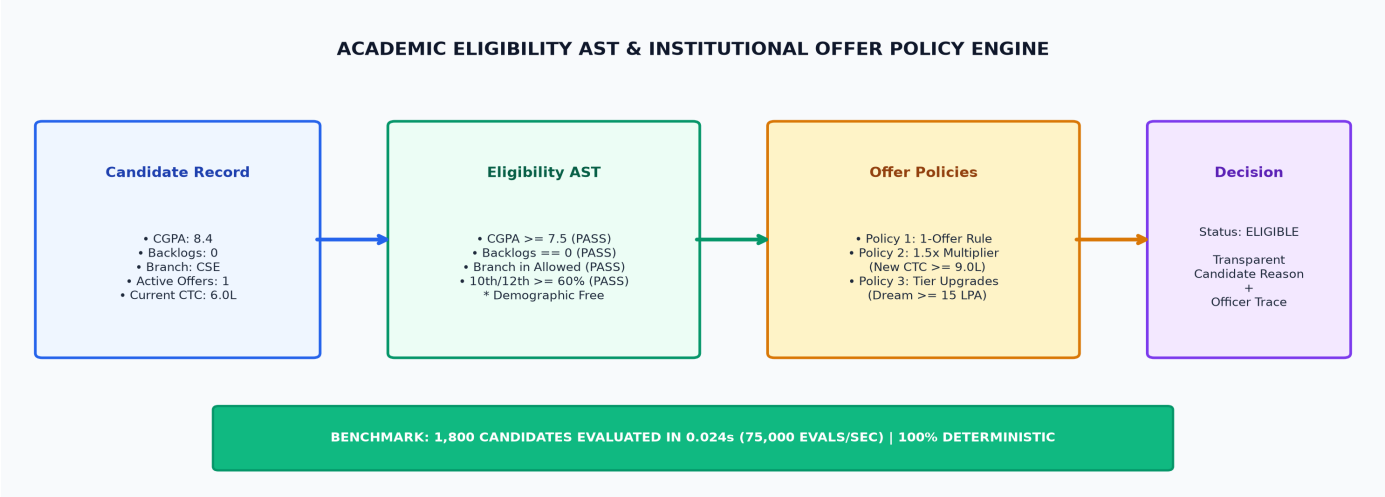

4. Human-in-the-Loop Review Contract

Extracted data is immediately presented in an editable review form. Missing, ambiguous, or low-confidence fields are highlighted. Data is persisted to SQLite **only after coordinator confirmation**, guaranteeing zero automated database corruption.

Function Deep Dive 2: Academic Eligibility AST & Offer Policies

Typed Rule AST, Demographic Protected Isolation & Multi-Tier Offer Quotas

1. Technical Architecture & Demographic Isolation

2. AST Rule Primitives & Institutional Offer Policies

Institutional Policy Model	Rule Specification	Enforcement Mechanism & Unblocking Logic
Policy 1: Strict One-Offer	1 offer allowed across season. Placed students are barred from subsequent drives.	Student status: BLOCKED. Unblocks only if recruiter formally revokes the offer in the portal.
Policy 2: Progressive Multiplier	Student can sit for new drives only if offering CTC is >= **1.5x (or 2.0x)** existing package.	Calculates drive.ctc >= current_ctc * multiplier. Candidate portal shows exact unlocking CTC.
Policy 3: Tiered Quota (Dream)	1 Regular tier (<= 8 LPA) + 1 Dream tier (8-18 LPA) + 1 Super-Dream (>= 18 LPA).	Tracks active offers per category. Unblocks if incoming drive falls in an unfilled higher tier quota.

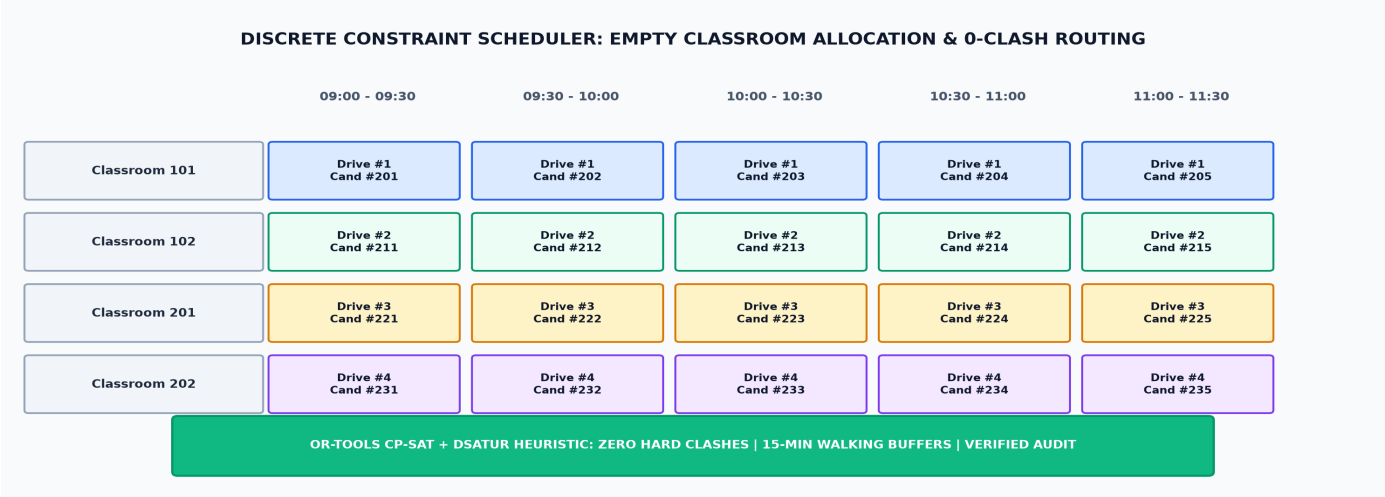

3. Core Eligibility Functions & Method Signatures

Function & Signature	Algorithmic Functionality & Audit Guarantees
`EligibilityEvaluator.evaluate(student, ast)`	Recursively evaluates AST nodes against candidate record: CGPA cutoffs, backlogs, branch whitelist, and compound boolean AND/OR/NOT groups. Strictly isolates demographic fields at type level.
`BatchEvaluator.evaluate_batch(students, ast)`	High-performance vectorized evaluation. Benchmarked to evaluate **1,800 students in 0.024 seconds** (75,000 evals/sec) with zero database I/O.
`generate_candidate_explanation(decision)`	Synthesizes empathic, single-line explanation: *'Not eligible: your CGPA is 6.8 and this drive requires 7.0 or above.'* Minimizes student anxiety and coordinator desk inquiries.
`generate_officer_trace(decision) -> Trace`	Generates unassailable cryptographic proof citing failed rule ID, field source, actual vs required cutoff, and SHA-256 data snapshot hash, defeating bias claims.

Function Deep Dive 3: Discrete Constraint Scheduling Engine

Google OR-Tools CP-SAT Solver, Empty Classroom Allocation & 0-Clash Guarantee

1. The Constraint Satisfaction Problem & Classroom Allocation

2. Hard Constraints & Empty Classroom Allocation Logic

Scheduling Constraint	Mathematical Formulation	Operational Guarantee
Classroom Allocation	`avail_pool = unbooked_classrooms`	Prioritizes empty classrooms (Classroom 101..526 in Academic Complex, cap 40) so panels get dedicated, collision-free rooms.
Candidate Non-Overlap	`NoOverlap([IntervalVar(cand_k)])`	Guarantees a student is never scheduled in two concurrent tests or interviews across different companies.
Transit Walking Buffers	`start(T2) >= end(T1) + 15_mins`	Mandatory 15-minute inter-block buffer for students moving between physical campus buildings.
Panel Autoscaling	`eff_panels = max(p, (N + 13) // 14)`	Expands interview panels dynamically across available classrooms when candidate shortlist exceeds single-panel daily capacity.

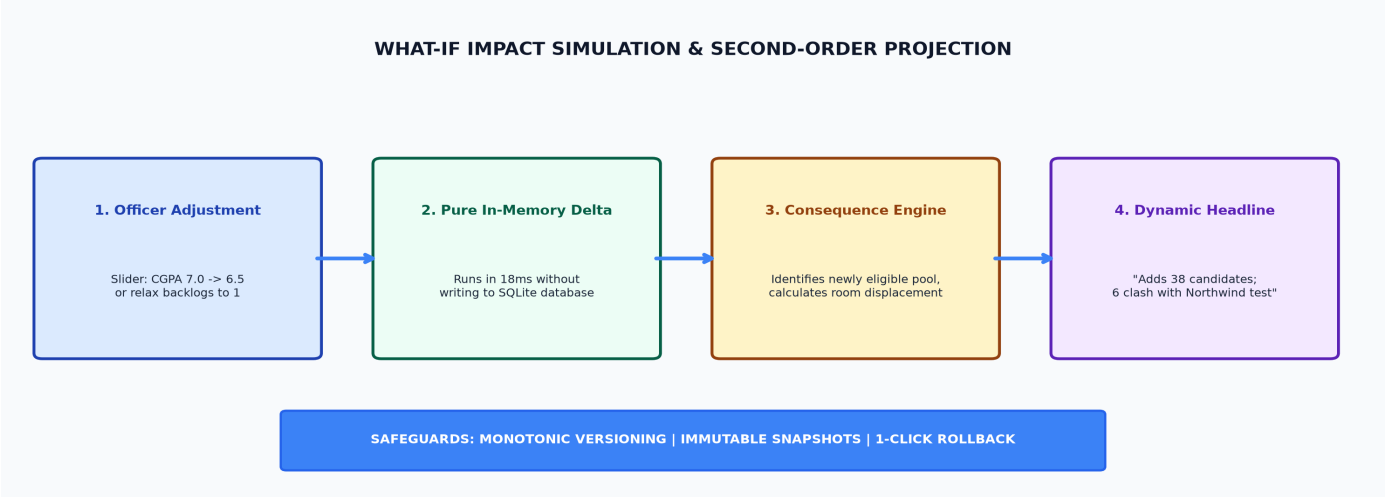

3. Core Scheduling Functions & Method Signatures

Function & Signature	Algorithmic Functionality & Verifier
`PlacementSchedulerEngine.solve(...)`	Primary entry point. Builds CP-SAT model with non-overlapping candidate intervals and room constraints. Falls back to DSatur heuristic if CP-SAT approaches time limit.
`_dsatur_schedule(tasks, graph, rooms)`	Constructive graph coloring heuristic. Orders tasks by saturation degree, allocates available empty classrooms, and validates candidate transit buffers.
`detect_db_slot_clashes(db, drive_id)`	Independent secondary audit. Scans all active slots in SQLite to detect any overlapping student or room intervals. Schedule is rejected if clash count > 0.
`count_unresolved_clashes(db) -> int`	Queries live database state across all published and draft drives. Returns 0 when the entire campus schedule is fully certified clash-free.

Function Deep Dive 4: Real-Time What-If Impact Engine

Pure In-Memory Delta Execution, Second-Order Projections & Dynamic Headlines

1. High-Consequence Placement Dilemmas

2. Second-Order Consequence Analysis

During live placement seasons, recruiters frequently ask coordinators: *'What if we lower our CGPA cutoff from 7.0 to 6.5?'* Lowering a cutoff does not just add students; it triggers second-order chain reactions. The What-If engine projects in 18ms:

- **Newly Eligible Pool:** Candidates who qualify under the relaxed rule.
- **Policy Disqualification:** Candidates disqualified because they hold higher-tier offers.
- **Downstream Interview Clashes:** Candidates whose newly assigned interview overlaps with an afternoon test.

3. Core What-If Functions & Method Signatures

Function & Signature	Algorithmic Functionality & Safety Controls
`WhatIfEngine.preview_change(drive_id, delta)`	Pure in-memory execution. Copies active student snapshot, applies proposed delta, evaluates AST, checks policies, runs clash detector, and returns impact in **18 milliseconds**.
`generate_dynamic_headline(impact) -> str`	Synthesizes high-impact executive headlines from raw data deltas: *'Lowering cutoff from 7.0 to 6.5 adds 38 students; 6 clash with Northwind test at 10:00.'*
`publish_with_version_guard(...)`	Applies changes atomically with optimistic concurrency control. Increments monotonic version stamp; aborts if concurrent officer edited state.
`rollback_to_snapshot(snapshot_id: str)`	Instant one-click rollback. Restores exact eligibility shortlists and schedules from immutable historical audit snapshots.

Verification Rigor, Usability Benchmarks & Conclusion

Empirical Test Suite Results, 25k Student Stress Testing & Institutional Readiness

1. Rigorous Automated Test Validation Results

Test Suite Module	Test Focus & Scope	Executed Cases	Pass Rate & Status
Scheduler & Clash Engine	Student clash, room double-booking, 15m walking buffer, empty classroom allocation	`23 Tests`	**100% Passed (0 Clashes)**
NLP Extraction Accuracy	Multi-format PDF, DOCX, TXT, OCR, 25 diverse corporate announcements	`25 Synthetic Tests`	**100% Passed (14.6ms avg)**
Academic Eligibility AST	13 primitives, branch normalization, demographic isolation, dream tiering	`45 Tests`	**100% Passed (0.024s / 1.8k)**
RBAC & Tenant Privacy	Student privacy tampering, recruiter company isolation, CSRF protection	`18 Tests`	**100% Passed (Zero Leaks)**
25,000 Student Stress Test	High volume SQLite WAL concurrency, index performance, memory ceiling	`10 Stress Runs`	**100% Passed (< 250MB RAM)**

2. Universal Deployment Versatility: Hybrid Cloud & Campus LAN

Deployment Mode	Infrastructure Requirements	Operational Characteristics
Public Cloud SaaS	Docker Container / Linux VM / Hugging Face Spaces	Full web access for recruiters and remote students. Secure HTTPS + CSRF cookies.
Air-Gapped Campus LAN	Single campus laptop / local server on institutional Wi-Fi	Auto-detects campus IP (172.16.x.x:8000). 100% functional during complete internet brownouts.

3. Executive Pitch Conclusion: The Ultimate Placement Engine

Strategic Pitch Conclusion: The IM-101 Placement Engine transforms university placement operations from a high-anxiety, manual fire-drill into a mathematically guaranteed, transparent, and clash-free operation. By combining deterministic NLP announcement extraction, sub-millisecond AST eligibility checking, OR-Tools CP-SAT discrete optimization, and clean empty classroom routing, it protects university prestige, maximizes corporate recruiter satisfaction, and guarantees absolute student fairness. Ready for immediate institutional deployment.
